APPENDIX C

SITE INSPECTION WORKSHEETS

This appendix consists of worksheets that can be used to generate an SI site score. Completion of these worksheets is not required, but the SI investigator must evaluate an SI score, either by these worksheets, *PREscore*, or other Regional scoring tools.

The worksheets consist of instructions and data tables to be filled in with scores from HRS reference tables. The data tables may also call for Data Type and References.

DATA TYPE: The Data Type columns should be filled in with an H, Q, or + if the data are HRS quality and well documented. The Data Type column should be filled in with an E, X, or - if the data represent estimates, approximations, or are not fully documented. This type identifies data gaps for the expanded SI to investigate.

REFERENCES: The Reference columns should be filled in with coded reference numbers. The numbered reference list should be attached or the numbering should be cross-referenced to the SI Narrative Report.

The SI investigator will need the current Superfund Chemical Data Matrix (SCDM) OSWER Directive 9345.1-13 (revised semi-annually) to complete these worksheets.

GENERAL INFORMATION

Site Description and Operational History: Provide a brief description of the site and its operational history. State the site name, owner, operator, type of facility and operations, size of property, active or inactive status, and years of waste generation. Summarize waste treatment, storage, or disposal activities that have or may have occurred at the site; note whether these activities are documented or alleged. Identify all source types and prior spills, floods, or fires. Summarize highlights of the PA and other investigations. Cite references.

This image shows a single page of white paper with horizontal black ruling lines. The lines are evenly spaced and run across the width of the page. There is a vertical margin line on the left side, creating a narrow left margin. The paper appears to be from a notebook or a standard ruled sheet of paper. There is no handwriting or other markings on the page.

Location

The Cracker Asphalt Facility (CAF) is located in Moundville, Tuscaloosa County, Alabama. The geographic coordinates are 33° 00' 42.86" North latitude and 87° 37' 22.18" West longitude. The town of Moundville is a small incorporated community consisting of approximately 1,348 residents.

The Moundville area has a moist subtropical climate with precipitation well distributed throughout the year. Tuscaloosa County receives precipitation of 0.10 inch or more approximately 75 days out of each year and has an average yearly precipitation of 49.26 inches.

The mean annual temperature for Tuscaloosa County is approximately 63.4° F. On a monthly average, January is the coldest and July is the warmest. January has an average daily maximum temperature of 54.9° F and an average daily minimum temperature of 33.5° F. July has an average daily maximum temperature of 91.7° F and an average daily minimum of 70.2° F.

Site Description

The CAF site is located in the SW 1/4 of the NW 1/4 and the NW 1/4 of the SW 1/4 of Section 31, Township 24 North, Range 5 East in Tuscaloosa County, Alabama. The CAF site is bound on north by pine forest and swamp land, and then by the Black Warrior River; on the south by rail road tracks, and then by residential property and farm land; on the east by a dirt methane well access road, and then by pine forest and swamp land; on the west by Lawter Chemical Plant, and then by the Mound State Monument. The nearest residential property is approximately 400 feet to the south of the site.

The CAF site is an approximately 25-acre dogleg shaped parcel of land. It is presently improved with 9 buildings, 24 above ground storage tanks and a lagoon that captures much of the surface water runoff from the site. The site is accessible to the general public from all directions. The only part of the site currently being utilized are the buildings on the site.

The CAF site is approximately 100 to 175 feet above mean sea level with a 2 to 6 percent sloping topography. All the Area surrounding the CAF site is at elevations lower than that of the site. Therefore, surface water runoff from the surrounding area would not flow across site under normal conditions. The Black Warrior River runs along the northwest boundary of the CAF site and is the nearest probable point of entry (PPE) into the surface water pathway for runoff exiting from the site.

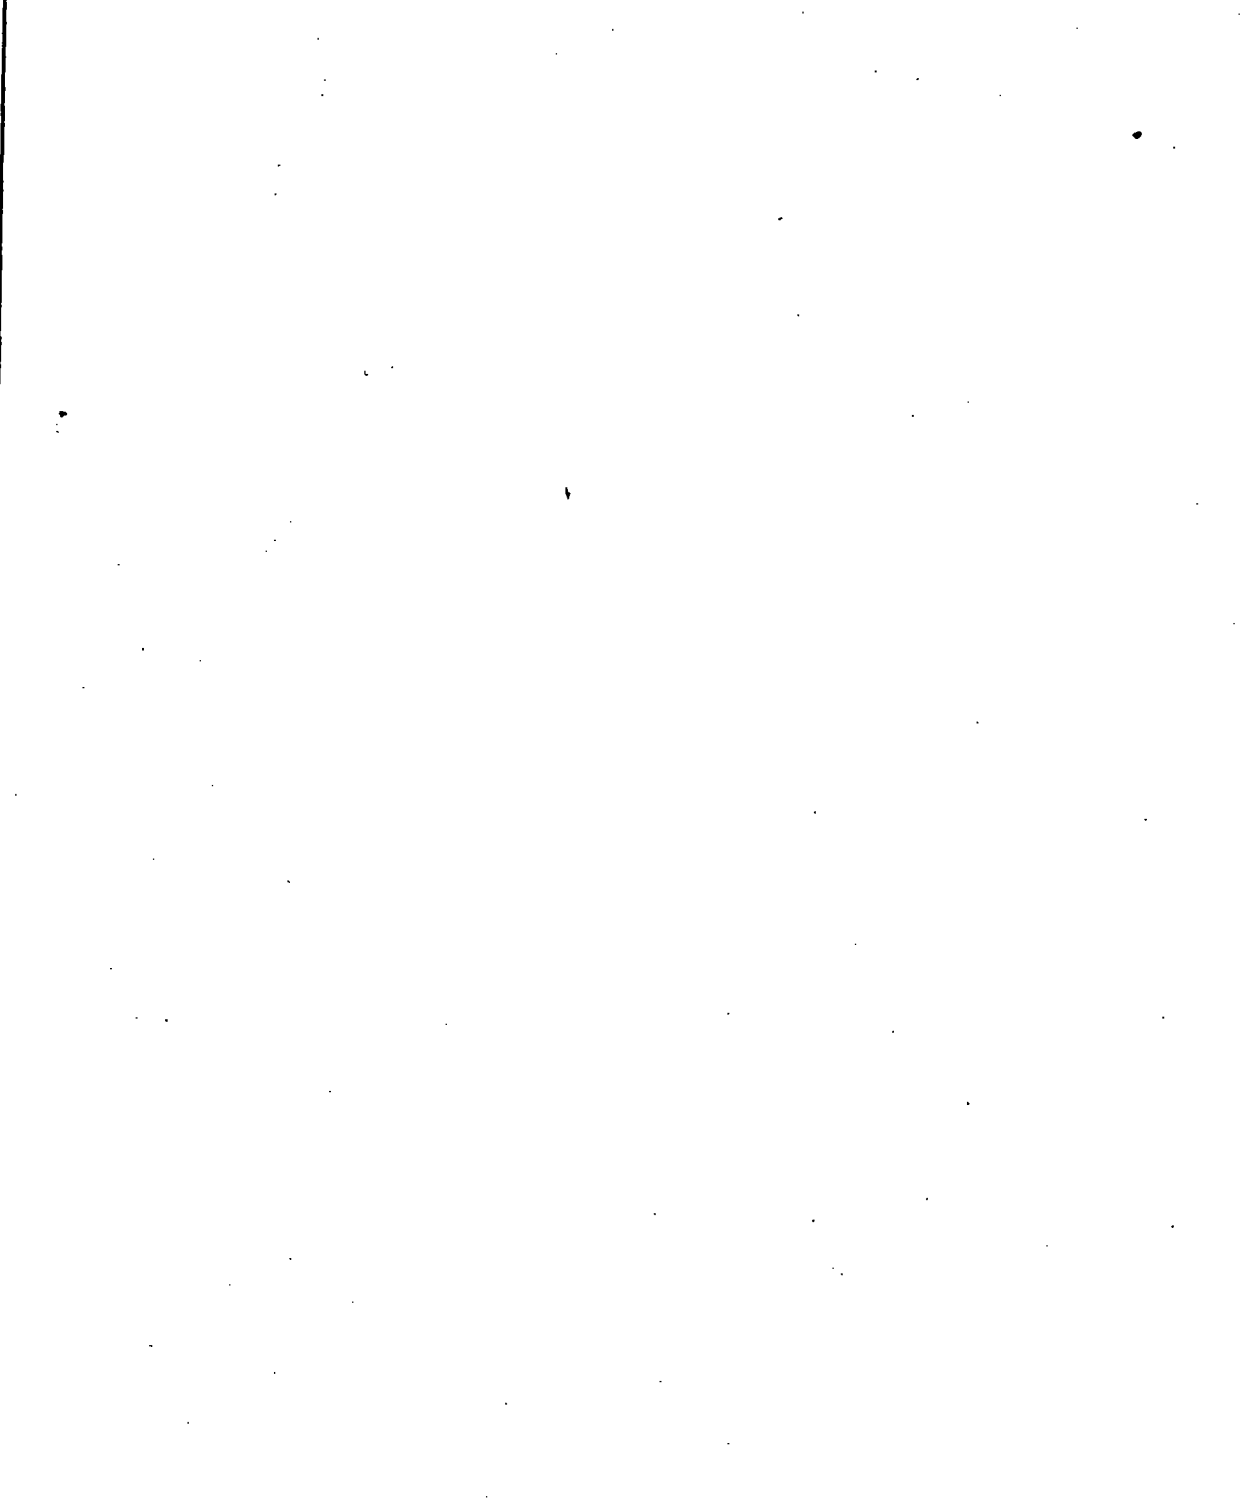

Operational History and Waste Characteristics

During a bankruptcy sale that took place in 1968, Conrad Wesselhoeft purchased the CAF site. The CAF site was previously owned by Cracker Asphalt Company, an asphalt refining and storage company. The Cracker Asphalt Company left behind warehouses, shops, various types of petroleum and asphalt processing equipment, a cooling pond, a sediment pond and several large above ground storage tanks. After purchasing the property, Mr. Wesselhoeft's metal fabrication business made use of the office, shops, warehouses and much of the open space on the site. Mr. Wesselhoeft also has occasionally leased one of the tanks (350,000 gallon capacity) on the site to Southern Resins Company (EPA ID #: ALD004034138) for storage of by-product petroleum solvents.

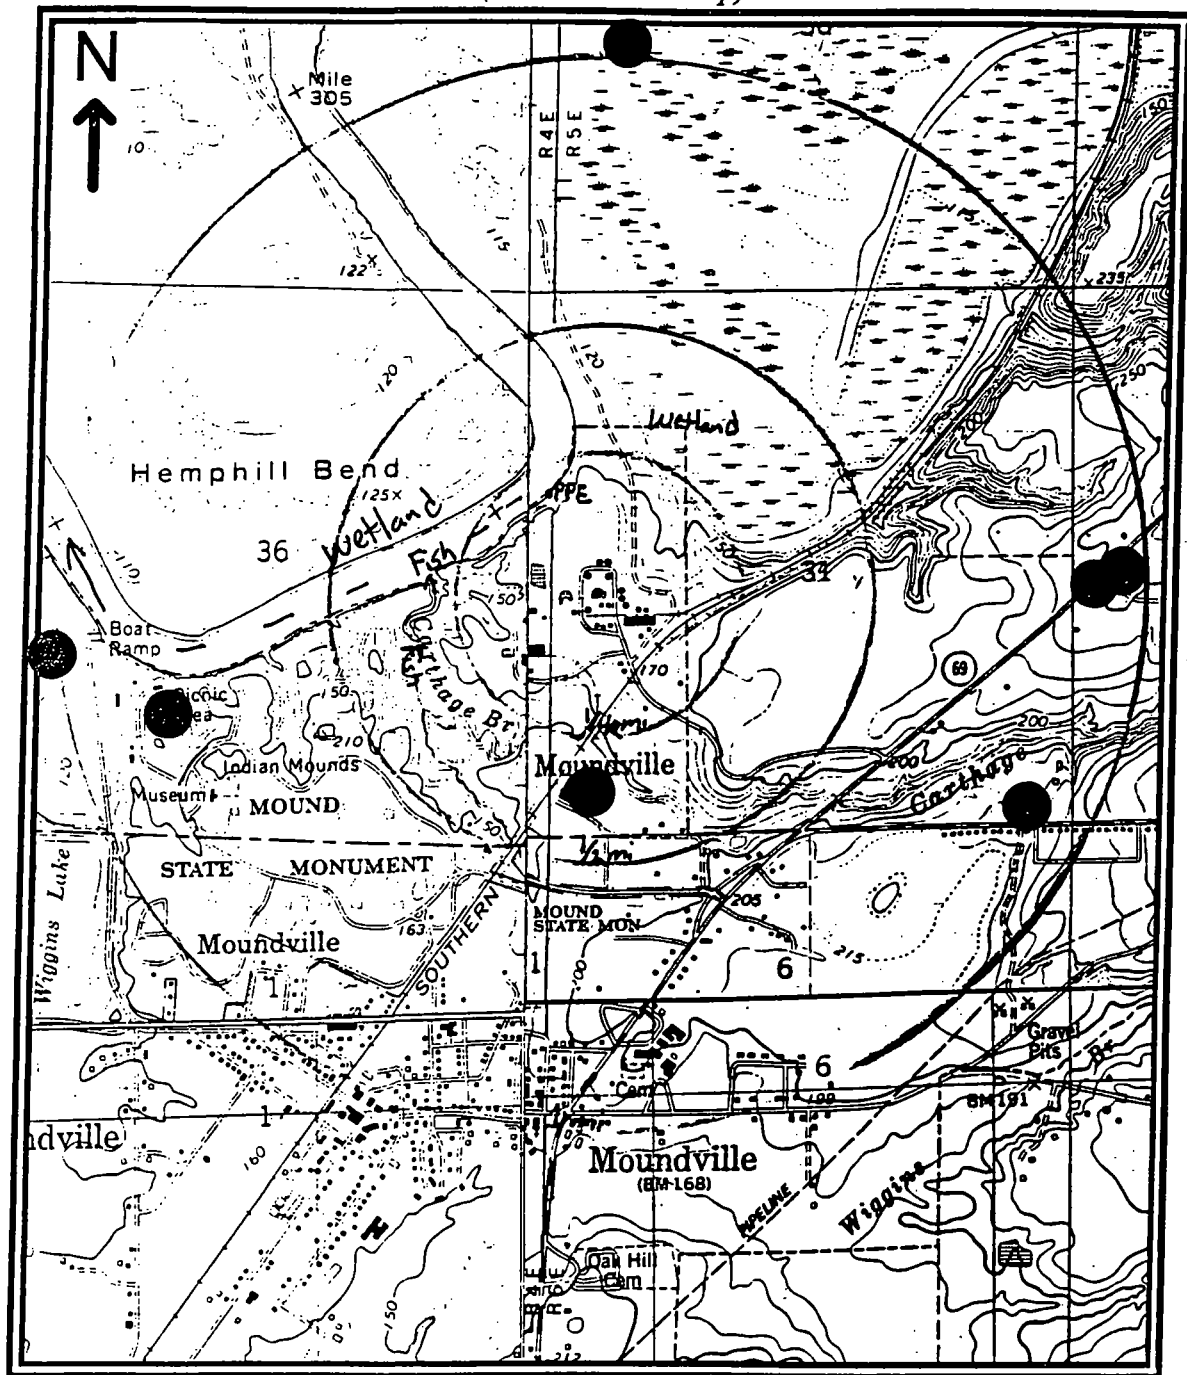

The possible sources of the documented and suspected contamination coming from the CAF site include a sludge pond, a cooling pond, two asphalt skimmer trenches, a tank that has occasionally been used to store petroleum solvents, and several other tanks that have not been used since the bankruptcy of the Cracker Asphalt Company.

GENERAL INFORMATION (continued)

Site Sketch: Provide a sketch of the site. Indicate all pertinent features of the site and nearby environments including sources of wastes, areas of visible and buried wastes, buildings, residences, access roads, parking areas, fences, fields, drainage patterns, water bodies, vegetation, wells, sensitive environments, and other features.

GENERAL INFORMATION (continued)

Source Descriptions: Describe all sources at the site. Identify source type and relate to waste disposal operations. Provide source dimensions and the best available waste quantity information. Describe the condition of sources and all containment structures. Cite references.

SOURCE TYPES

Landfill: A man-made (by excavation or construction) or natural hole in the ground into which wastes have come to be disposed by backfilling, or by contemporaneous soil deposition with waste disposal.

Surface Impoundment: A natural topographic depression, man-made excavation, or diked area, primarily formed from earthen materials (lined or unlined) and designed to hold an accumulation of liquid wastes, wastes containing free liquids, or sludges not backfilled or otherwise covered; depression may be wet with exposed liquid or dry if deposited liquid has evaporated, volatilized or leached; structures that may be described as lagoon, pond, aeration pit, settling pond, tailings pond, sludge pit; also a surface impoundment that has been covered with soil after the final deposition of waste materials (i.e., buried or backfilled).

Drum: A portable container designed to hold a standard 55-gallon volume of wastes.

Tank and Non-Drum Container: Any device, other than a drum, designed to contain an accumulation of waste that provides structural support and is constructed primarily of fabricated materials (such as wood, concrete, steel, or plastic); any portable or mobile device in which waste is stored or otherwise handled.

Contaminated Soil: An area or volume of soil onto which hazardous substances have been spilled, spread, disposed, or deposited.

Pile: Any non-containerized accumulation above the ground surface of solid, non-flowing wastes; includes open dumps. Some types of waste piles are:

- **Chemical Waste Pile:** A pile consisting primarily of discarded chemical products, by-products, radioactive wastes, or used or unused feedstocks.
- **Scrap Metal or Junk Pile:** A pile consisting primarily of scrap metal or discarded durable goods (such as appliances, automobiles, auto parts, batteries, etc.) composed of materials containing hazardous substances.
- **Tailings Pile:** A pile consisting primarily of any combination of overburden from a mining operation and tailings from a mineral mining, beneficiation, or processing operation.
- **Trash Pile:** A pile consisting primarily of paper, garbage, or discarded non-durable goods containing hazardous substances.

Land Treatment: Landfarming or other method of waste management in which liquid wastes or sludges are spread over land and tilled, or liquids are injected at shallow depths into soils.

Other: Sources not in categories listed above.

SOURCE EVALUATION

Source No.: 1	Source Name: Skimmer Trench	Source Waste Quantity (WQ) Calculations:
Source Description: 7,200 cubic foot oil and asphalt skimmers (surface impoundment)		$7,200 / 67.5 = 107$

Source No.: 2	Source Name: Sludge Pond	Source Waste Quantity (WQ) Calculations:
Source Description: 65,000 cubic foot pond backfilled with petroleum contaminated sludge and sediment (surface impoundment)		$65,000 / 67.5 = 963$

Source No.: 3	Source Name: Contaminated Soil	Source Waste Quantity (WQ) Calculations:
Source Description:		$25 \text{ acres} / 0.78 = 32$

Source No.: 4	Source Name: Tanks	Source Waste Quantity (WQ) Calculations:
Source Description: 5,350,000 gallon capacity tanks with approximately 1 percent residue remaining in the tanks = 53,000 gallons of residue		$53,500 / 500 = 107$

Source No.: 5	Source Name: Contaminated Groundwater	Source Waste Quantity (WQ) Calculations:
Source Description: Source of contamination is unknown but could be Crackers sludge pond, Crackers west tank or Lawters unlined waste water treatment plant		$10 \text{ acre plume?} \times 4356 \text{ feet per acre} \times 10 \text{ foot of water?}$ $\times .20 \% \text{ pore space in aquifer} = 10 \times 43,560 \times 10 \times 0.2 =$ $871,200 \quad 871,200 / 67.5 = 12,906.67$

GENERAL INFORMATION (continued)

Source Description: Include description of containment per pathway for ground water (see HRS Table 3-2), surface water (see HRS Table 4-2), and air (see HRS Tables 6-3 and 6-9).

HAZARDOUS WASTE QUANTITY (HWQ) CALCULATION

For each migration pathway, evaluate HWQ associated with sources that are available (i.e., incompletely contained) to migrate to that pathway. (Note: If *Actual Contamination Targets* exist for ground water, surface water, or air migration pathways, assign the calculated HWQ score or 100, whichever is greater, as the HWQ score for that pathway.) For each source, evaluate HWQ for one or more of the four tiers (SI Table 1; HRS Table 2-5) for which data exist: constituent quantity, wastestream quantity, source volume, and source area. Select the tier that gives the highest value as the source HWQ. Select the source volume HWQ rather than source area HWQ if data for both tiers are available.

Column 1 of SI Table 1 indicates the quantity tier. Column 2 lists source types for the four tiers. Columns 3, 4, 5, and 6 provide ranges of waste amount for sites with only one source, corresponding to HWQ scores at the tops of the columns. Column 7 provides formulas to obtain source waste quantity values at sites with multiple sources.

1. Identify each source type.
2. Examine all waste quantity data available for each source. Record constituent quantity and waste stream mass or volume. Record dimensions of each source.
3. Convert source measurements to appropriate units for each tier to be evaluated.
4. For each source, use the formulas in the last column of SI Table 1 to determine the waste quantity value for each tier that can be evaluated. Use the waste quantity value obtained from the highest tier as the quantity value for the source.
5. Sum the values assigned to each source to determine the total site waste quantity.
6. Assign HWQ score from SI Table 2 (HRS Table 2-6).

Note these exceptions to evaluate soil exposure pathway HWQ (see HRS Table 5-2):

- The divisor for the area (square feet) of a landfill is 34,000.
- The divisor for the area (square feet) of a pile is 34.
- Wet surface impoundments and tanks and non-drum containers are the only sources for which volume measurements are evaluated for the soil exposure pathway.

SI TABLE 2: HWQ SCORES FOR SITES

Site WQ Total	HWQ Score
0	0
1 ^a to 100	1 ^b
> 100 to 10,000	100
> 10,000 to 1 million	10,000
> 1 million	1,000,000

^a If the WQ total is between 0 and 1, round it to 1.

^b If the hazardous constituent quantity data are not complete, assign the score of 10.

C-11

Ground Water Observed Release Substances Summary Table

On SI Table 4, list the hazardous substances associated with the site detected in ground water samples for that aquifer. Include only those substances directly observed or with concentrations significantly greater than background levels. Obtain toxicity values from the Superfund Chemical Data Matrix (SCDM). Assign mobility a value of 1 for all observed release substances regardless of the aquifer being evaluated. For each substance, multiply the toxicity by the mobility to obtain the toxicity/mobility factor value; enter the highest toxicity/mobility value for the aquifer in the space provided.

Ground Water Actual Contamination Targets Summary Table

If there is an observed release at a drinking water well, enter each hazardous substance meeting the requirements for an observed release by well and sample ID on SI Table 5 and record the detected concentration. Obtain benchmark, cancer risk, and reference dose concentrations from SCDM. For MCL and MCLG benchmarks, determine the highest percentage of benchmark obtained for any substance. For cancer risk and reference dose, sum the percentages for the substances listed. If benchmark, cancer risk, or reference dose concentrations are not available for a particular substance, enter N/A for the percentage. If the highest benchmark percentage or the percentage sum calculated for cancer risk or reference dose equals or exceeds 100%, evaluate the population using the well as a Level I target. If these percentages are less than 100% or all are N/A, evaluate the population using the well as a Level II target for that aquifer.

GROUND WATER

Hydrogeology

The CAF site and the surrounding area lie within the Alluvial-Deltic Plain district of the East Gulf Coastal Plain physiographic section. The prominent physiographic feature of this area is the broad, well developed, flat flood plains and terraces that have been formed by the meandering Black Warrior River. (Reference 5, p. 3)

The geologic units that outcrop in Moundville and the surrounding area are of sedimentary origin and consist of gravel, sand, silt and clay (Reference 6, p. 3-4). At the CAF site, alluvium and terrace deposits of Quaternary age overlie the Cretaceous age Gordo and Coker formations of the Tuscaloosa Group (Reference 5, p. 6-8).

The Quaternary flood plain deposits can be as much as 100 feet thick, and consist mainly of gravel, sand, silt and clay (Reference 7, p. 12). The Gordo Formation, which lies beneath the flood plain deposits, is as much as 400 feet thick, and consist of sand and gravel overlain by alternating lenticular beds of sand and mottled clay (Reference 5, p. 6-8 and 21). The Coker formation, which lies beneath the Gordo Formation, ranges in thickness from less than 100 feet to up to 1,000 feet. The Coker Formation consists of a nonmarine zone of gravel overlain by marine sand and clay. The nonmarine basal zone is generally separated from the marine sand beds by 50 feet or more of clay (Reference 5, p. 8).

Sand and gravel beds of the Tuscaloosa Group are the major sources of ground water in the study area. Alluvium and terrace deposits may also contain sand and gravel aquifers that are capable of yielding enough water for a private domestic or stock supply. (Reference 5, p. 12-15)

According to the outcrops along the river bank north of the site (Figure 4) and the bore hole logs from the property west of the site (Attachment 6), the terrace deposits consist of an upper fine-grained unit and a basal coarse-grained unit that lies unconformably atop the eroded remnants of the Gordo Formation. The base of the terrace deposits is considered to be the lowest occurrence of gravel.

The Gordo Formation, as seen in the bore hole logs (Attachment 6), consist of an upper unit of sand having zones of high iron content intermingled with layers of sandy clay and clayey sand and a basal unit of fine to medium sand. The contact between the Gordo Formation and the Coker Formation, as seen in the outcrops along the river bank, is a 1/2 inch layer of iron cemented sandstone underlain by massive red, purple, gray and brown mottled clay.

The terrace and Gordo deposits thicken in a westward direction and are estimated to 35 to 120 feet in thickness underneath the CAF site.

Ground Water Targets

There are many private wells and two public water supply wells within the 4-mile ground water target radius (Attachment 1; Attachment 2; Plate 1). The water from the two public water supply wells are blended together to make up 100 percent of the Moundville Water Works system. The Moundville Water Works has 1,348 connections on its system. The Moundville Water Works also sells 300,000 gallons of water per day to the Hale County Water System (Reference 8).

The Hale County Water System purchases 40 percent of its systems water from Moundville Water Works and 60 percent from Greensboro Water System. The water that the Hale County Water System buys is blended together before it is used by 2,500 purchasers. (PA # 6243, Att. 5 & 6)

Describe Ground Water Use within 4 Miles of the Site:
Describe generalized stratigraphy, aquifers, municipal and private wells

Describe Ground Water Use within 4 Miles of the Site:
Describe generalized stratigraphy, aquifers, municipal and private wells

Show Calculations of Ground Water Drinking Water Populations for each Aquifer:
Provide apportionment calculations for blended supply systems.
 County average number of persons per household: 2.685 Reference 3

GROUND WATER PATHWAY WORKSHEET

LIKELIHOOD OF RELEASE	Score	Data Type	Refs
1. OBSERVED RELEASE: If sampling data or direct observation support a release to the aquifer, assign a score of 550. Record observed release substances on SI Table 4.	550		App. A
2. POTENTIAL TO RELEASE: Depth to aquifer: _____ feet. If sampling data do not support a release to the aquifer, and the site is in karst terrain or the depth to aquifer is 70 feet or less, assign a score of 500; otherwise, assign a score of 340. Optionally, evaluate potential to release according to HRS Section 3.	-	-	-
LR =		550	

TARGETS

<p>Are any wells part of a blended system? Yes <input checked="" type="checkbox"/> No <input type="checkbox"/></p> <p>If yes, attach a page to show apportionment calculations.</p>			
<p>3. ACTUAL CONTAMINATION TARGETS: If analytical evidence indicates that any target drinking water well for the aquifer has been exposed to a hazardous substance from the site, evaluate the factor score for the number of people served (SI Table 5).</p> <p>Level I: _____ people x 10 = _____</p> <p>Level II: _____ people x 1 = _____ Total =</p>	0		
<p>4. POTENTIAL CONTAMINATION TARGETS: Determine the number of people served by drinking water wells for the aquifer or overlying aquifers that are not exposed to a hazardous substance from the site; record the population for each distance category in SI Table 6a or 6b. Sum the population values and multiply by 0.1.</p>	136		Ref. 1 Ref. 3
<p>5. NEAREST WELL: Assign a score of 50 for any Level I Actual Contamination Targets for the aquifer or overlying aquifer. Assign a score of 45 if there are Level II targets but no Level I targets. If no Actual Contamination Targets exist, assign the Nearest Well score from SI Table 6a or 6b. If no drinking water wells exist within 4 miles, assign 0.</p>	5		Ref. 8
<p>6. WELLHEAD PROTECTION AREA (WHPA): If any source lies within or above a WHPA for the aquifer, or if a ground water observed release has occurred within a WHPA, assign a score of 20; assign 5 if neither condition applies but a WHPA is within 4 miles; otherwise assign 0.</p>	5		Ref. 8
<p>7. GROUND WATER PATHWAY WORKSHEET (concluded)

WASTE CHARACTERISTICS	Score	Data Type	Does not Apply
8. If any Actual Contamination Targets exist for the aquifer or overlying aquifers, assign the calculated hazardous waste quantity score or a score of 100, whichever is greater; if no Actual Contamination Targets exist, assign the hazardous waste quantity score calculated for sources available to migrate to ground water. <i>Data on Monitoring wells Only</i>	10,000	App. A App. B	
9. Assign the highest ground water toxicity/mobility value from SI Table 3 or 4.	100	Table 4	
10. Multiply the ground water toxicity/mobility and hazardous waste quantity scores. Assign the Waste Characteristics score from the table below: (from HRS Table 2-7)			

Product	WC Score
0	0
>0 to <10	1
10 to <100	2
100 to <1,000	3
1,000 to <10,000	6
10,000 to <1E + 05	10
1E + 05 to <1E + 06	18
1E + 06 to <1E + 07	32
1E + 07 to <1E + 08	56
1E + 08 or greater	100

WC = 32

Multiply LR by T and by WC. Divide the product by 82,500 to obtain the ground water pathway score for each aquifer. Select the highest aquifer score. If the pathway score is greater than 100, assign 100.

GROUND WATER PATHWAY SCORE:

$$\frac{LR \times T \times WC}{82,500}$$

32.21
(Maximum of 100)

$$550 \times 151 \times 32 = 2,653,600$$

SURFACE WATER PATHWAY

Sketch of the Surface Water Migration Route:

Label all surface water bodies. Include runoff route and drainage direction, probable point of entry, and 15-mile target distance limit. Mark sample locations, intakes, fisheries, and sensitive environments. Indicate flow directions, tidal influence, and rate.

SURFACE WATER PATHWAY

Surface Water Observed Release Substances Summary Table

On SI Table 7, list the hazardous substances detected in surface water samples for the watershed, which can be attributed to the site. Include only those substances in observed releases (direct observation) or with concentration levels significantly above background levels. Obtain toxicity, persistence, bioaccumulation potential, and ecotoxicity values from SCDM. Enter the highest toxicity/persistence, toxicity/persistence/bioaccumulation, and ecotoxicity/persistence/ecobioaccumulation values in the spaces provided.

- TP = Toxicity x Persistence
- TPB = TP x bioaccumulation
- ETPB = EP x bioaccumulation (EP = ecotoxicity x persistence)

Drinking Water Actual Contamination Targets Summary Table

For an observed release at or beyond a drinking water intake, on SI Table 8 enter each hazardous substance by sample ID and the detected concentration. For surface water sediment samples detecting a hazardous substance at or beyond an intake, evaluate the intake as Level II contamination. Obtain benchmark, cancer risk, and reference dose concentrations for each substance from SCDM. For MCL and MCLG benchmarks, determine the highest percentage of benchmark obtained for any substance. For cancer risk and reference dose, sum the percentages of the substances listed. If benchmark, cancer risk, or reference dose concentrations are not available for a particular substance, enter N/A for the percentage. If the highest benchmark percentage or the percentage sum calculated for cancer risk or reference dose equals or exceeds 100%, evaluate the population served by the intake as a Level I target. If the percentages are less than 100% or all are N/A, evaluate the population served by the intake as a Level II target.

SURFACE WATER PATHWAY

Human Food Chain Actual Contamination Targets Summary Table

On SI Table 10, list the hazardous substances detected in sediment, aqueous, sessile benthic organism tissue, or fish tissue samples (taken from fish caught within the boundaries of the observed release) by sample ID and concentration. Evaluate fisheries within the boundaries of observed releases detected by sediment or aqueous samples as Level II, if at least one observed release substance has a bioaccumulation potential factor value of 500 or greater (see SI Table 7). Obtain benchmark, cancer risk, and reference dose concentrations from SCDM. For FDAAL benchmarks, determine the highest percentage of benchmark obtained for any substance. For cancer risk and reference dose, sum the percentages for the substances listed. If benchmark, cancer risk, or reference dose concentrations are not available for a particular substance, enter N/A for the percentage. If the highest benchmark percentage sum calculated for cancer risk or reference dose equals or exceeds 100%, evaluate this portion of the fishery as subject to Level I concentrations. If the percentages are less than 100% or all are N/A, evaluate the fishery as a Level II target.

Sensitive Environment Actual Contamination Targets Summary Table

On SI Table 11, list each hazardous substance detected in aqueous or sediment samples at or beyond wetlands or a surface water sensitive environment by sample ID. Record the concentration. If contaminated sediments or tissues are detected at or beyond a sensitive environment, evaluate the sensitive environment as Level II. Obtain benchmark concentrations from SCDM. For AWQC/AALAC benchmarks, determine the highest percentage of benchmark of the substances detected in aqueous samples. If benchmark concentrations are not available for a particular substance, enter N/A for the percentage. If the highest benchmark percentage equals or exceeds 100%, evaluate that part of the sensitive environment subject to Level I concentrations. If the percentage is less than 100%, or all are N/A, evaluate the sensitive environment as Level II.

(maximum of 100)

28.26

SOIL EXPOSURE PATHWAY

If there is no observed contamination (e.g., ground water plume with no known surface source), do not evaluate the soil exposure pathway. Discuss evidence for no soil exposure pathway.

Soil Exposure Resident Population Targets Summary

For each property (duplicate page 35 as necessary):

If there is an area of observed contamination on the property and within 200 feet of a residence, school, or day care center, enter on Table 15 each hazardous substance by sample ID. Record the detected concentration. Obtain cancer risk, and reference dose concentrations from SCDM. Sum the cancer risk and reference dose percentages for the substances listed. If cancer risk or reference dose concentrations are not available for a particular substance, enter N/A for the percentage. If the percentage sum calculated for cancer risk or reference dose equals or exceeds 100%, evaluate the residents and students as Level I. If both percentages are less than 100% or all are N/A, evaluate the targets as Level II.

2.08
(Maximum of 100)

AIR PATHWAY

Air Pathway Observed Substances Summary Table

On SI Table 21, list the hazardous substances detected in air samples of a release from the site. Include only those substances with concentrations significantly greater than background levels. Obtain benchmark, cancer risk, and reference dose concentrations from SCDM. For NAAQS/NESHAPS benchmarks, determine the highest percentage of benchmark obtained for any substance. For cancer risk and reference dose, sum the percentages for the substances listed. If benchmark, cancer risk, or reference dose concentrations are not available for a particular substance, enter N/A for the percentage. If the highest benchmark percentage or the percentage sum calculated for cancer risk or reference dose equals or exceeds 100%, evaluate targets in the distance category from which the sample was taken and any closer distance categories as Level I. If the percentages are less than 100% or all are N/A, evaluate targets in that distance category and any closer distance categories that are not Level I as Level II.

No Data
